

Designing Your AAA Sequence

Use this section to map AAA at both scales: the full experience and the next lesson.

Name of Experience / Module / Pipeline:

Stage 1: Application

7. What real thing will the learner touch, test, make, or play with immediately?

The learner will make sense of their emotions

8. What productive friction do you want them to encounter here? What misconception should fail safely?

encounter an invader then should fail safely by not leading the team correctly.

Stage 2: Action

9. What are the 3-5 core concepts, definitions, or moves that should arrive only after Stage 1?

The core concepts will be hardware vs. software, input and output, basic programming logic, how code gives instructions to a computer, and basic troubleshooting.

10. How will the learner use those ideas to refine what they already began?

The learner will use these concepts to return to their original activity, understand why certain things worked or failed, and make improvements based on what they learned.

Stage 3: Amplification

11. What bigger frameworks, professional practices, or collaborative contexts will open here?

The learner can expand into larger concepts such as software development, computer engineering, networking, cybersecurity, and collaborative projects. They can also begin using professional practices such as testing, documentation, troubleshooting, and version control.

12. How does AAA work at the macro scale of the full experience and at the micro scale of one lesson or node?

At the macro level, the learner begins by experimenting, learns the concepts needed to understand the experience, and eventually applies them to larger projects. At the micro level, each lesson follows the same pattern: try something first, learn why it works, and then use that knowledge in a more advanced way.
